

SELECTIVE CALL MESSAGE MANAGEMENT

Abstract of the Disclosure

5 Messages received by a selective call receiver are stored in source files
with a user allocated number of message storage slots in response to a
message source signal indicating the source of the message. Messages are
retrieved utilizing the source files facilitating message location in large
10 memories. Source files are retrieved on a priority basis which is a function
of a predetermined priority associated with each source file and the status of
messages stored therein.
